Technical Analysis and Principles

- **Technical Analysis** is a form of security analysis that uses price and volume data for decision-making.

- Principles:
 1. Supply and demand for a security determine its price
 2. Change in supply & demand for a security causes a change in its price
 3. Prices can be projected by charts and other technical tools

Technical Analysis and Assumptions

1. There are rational and irrational (led by emotions) market participants

2. Technical analysis represents the study of collective investors' psychology or sentiment
3. Projecting the future price of a security by studying past investors' behavior

Technical Analysis and Applications

The infographic is set against a dark teal background. On the left, a white dashed-bordered box lists 'Commodities', 'Currencies', and 'Futures' with corresponding icons: a coffee bean for commodities, a dollar and euro symbol for currencies, and a document for futures. In the center, a trading floor scene with 'NYSE' signs and computer monitors is shown above a red pill-shaped button labeled 'Liquid markets'. Above this scene is a white dashed-bordered box stating 'Used when volume & price data is readily available'. To the right, a yellow warning triangle with an exclamation mark is next to the text 'Low trading volume'. Below this, a yellow sticky note with an orange pushpin contains the text 'Illiquid assets are not optimal for technical analysis'.

Other Tools Used in Technical Analysis

Trading Volume

- Trading Volume Graph, and Relative Strength Analysis

Trading Volume

- Supply and demand for a given stock
- It can be found at Yahoo!Finance

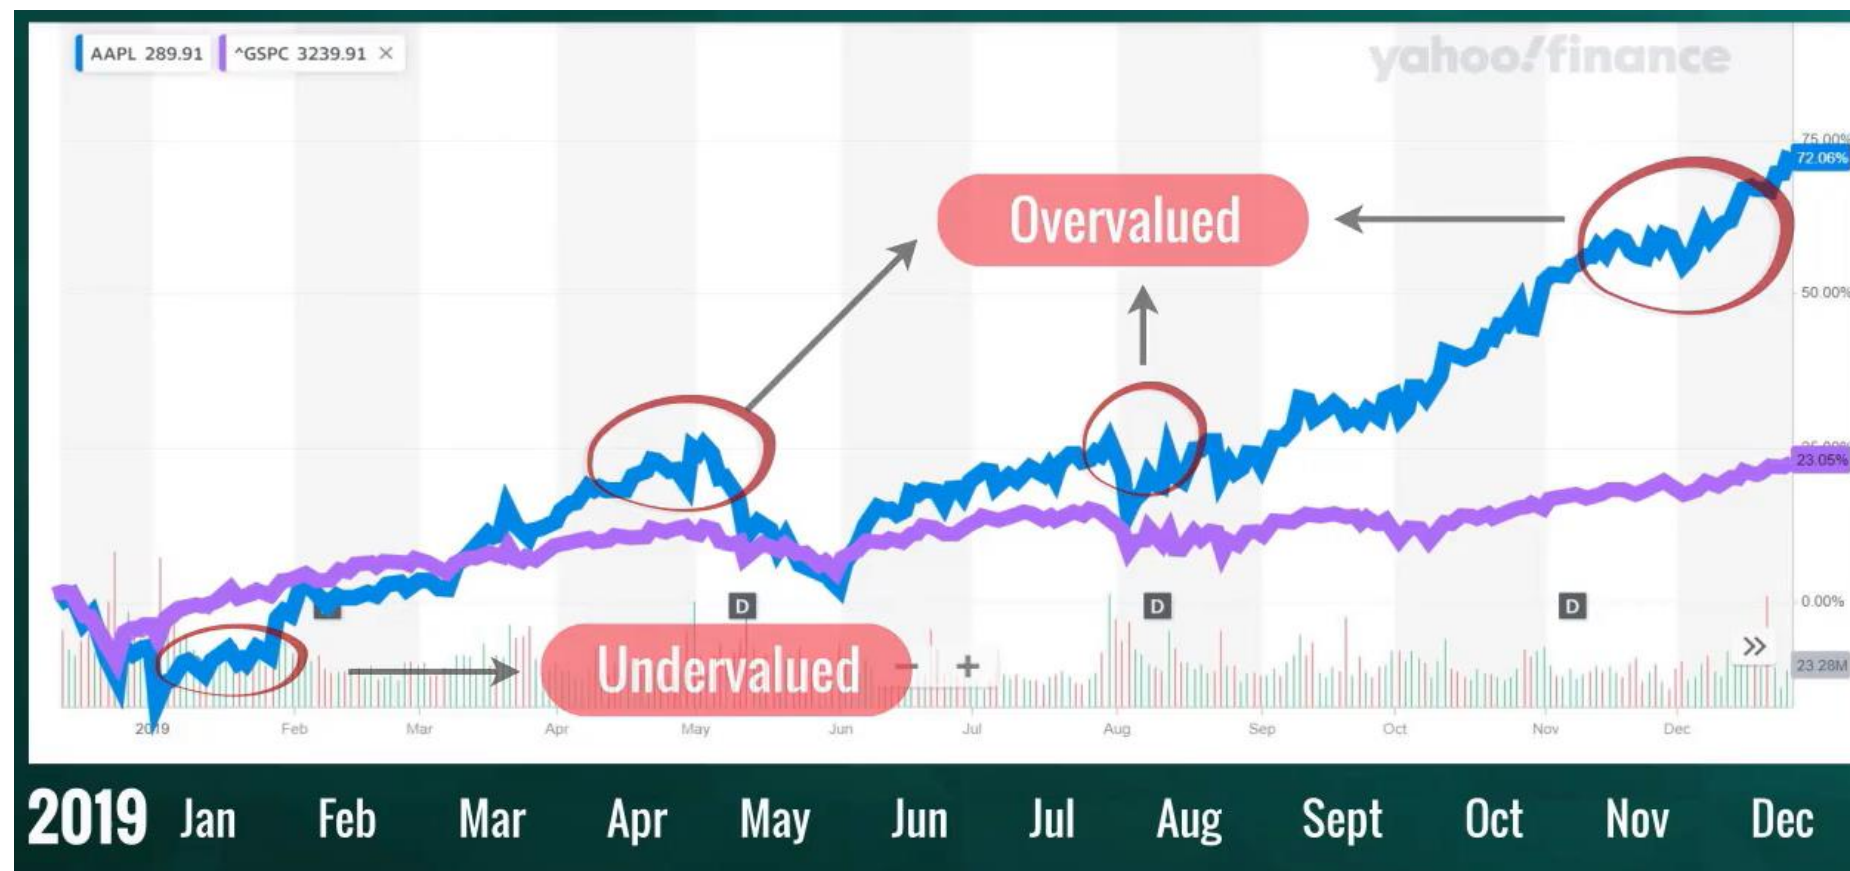

Trading Volume

Relative Strength Analysis

- Relative Strength Analysis compares a security's performance vs. other securities, its own industry, or the market in general as a benchmark

Trend, Support and Resistance Lines

Trend

- It is the epitome of investor herd mentality or “group think”

Trend

- The word “trend” designated a direction

Trend

Support & Resistance

- Support Level: “A price level that is expected to protect a security’s price from going under

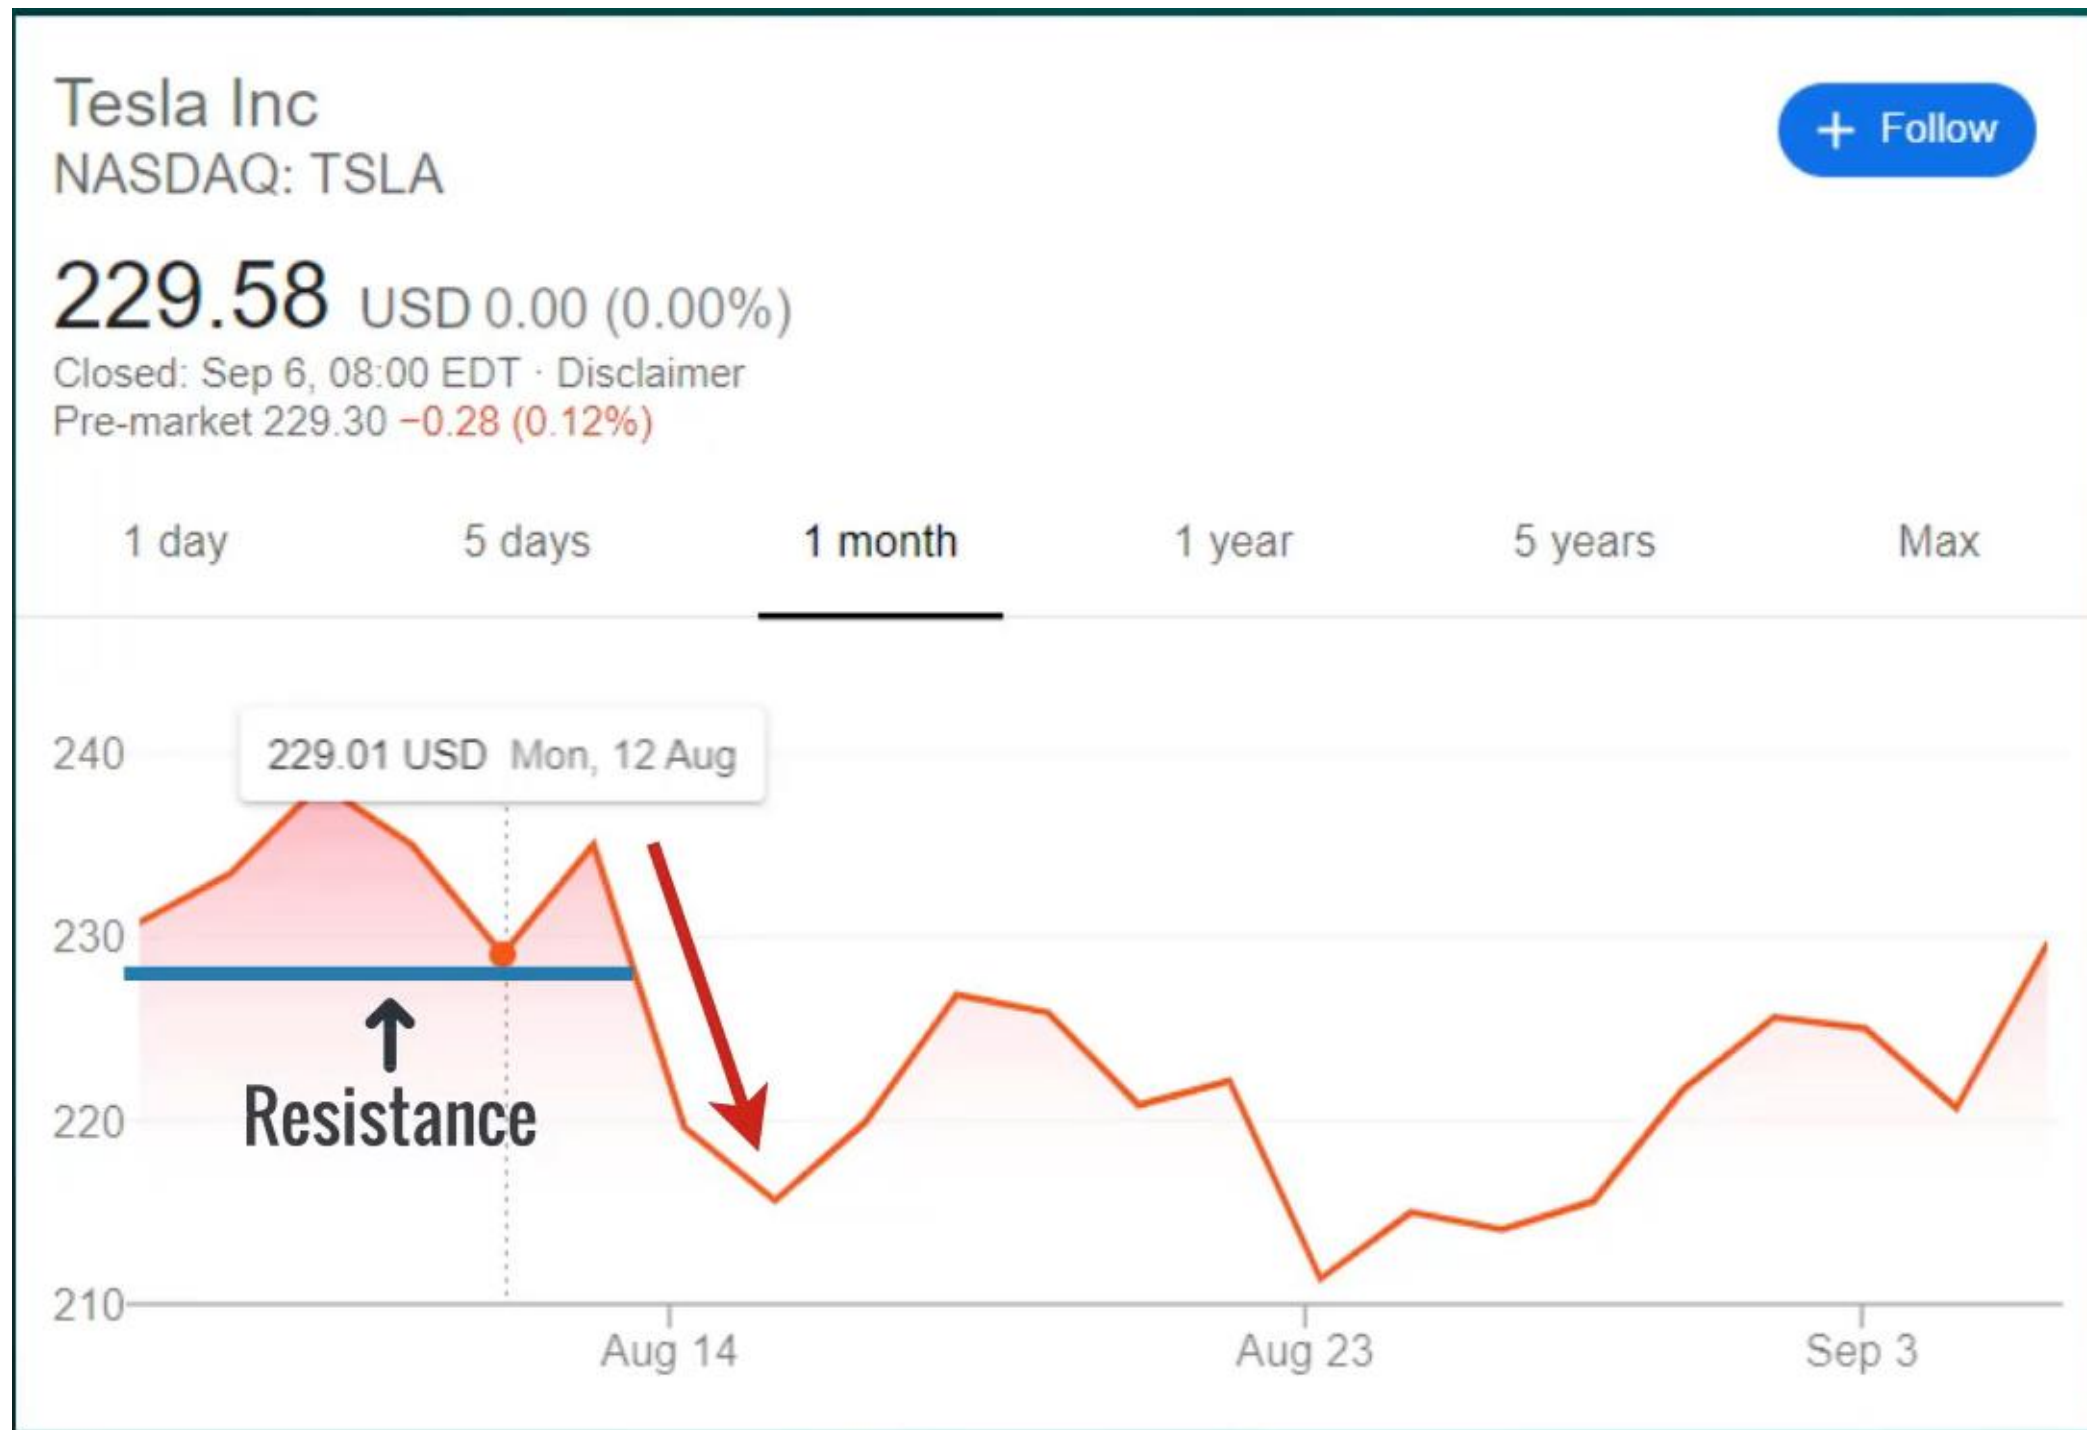

Support & Resistance

- Resistance level: A cap or ceiling in the price level of a security

Common Chart Patterns

-
- The art of the trade is in reading charts correctly by spotting patterns that aren't obvious for all traders.
 - Reversal patterns
 - Continuation patterns

$$T = N - (H - N)$$

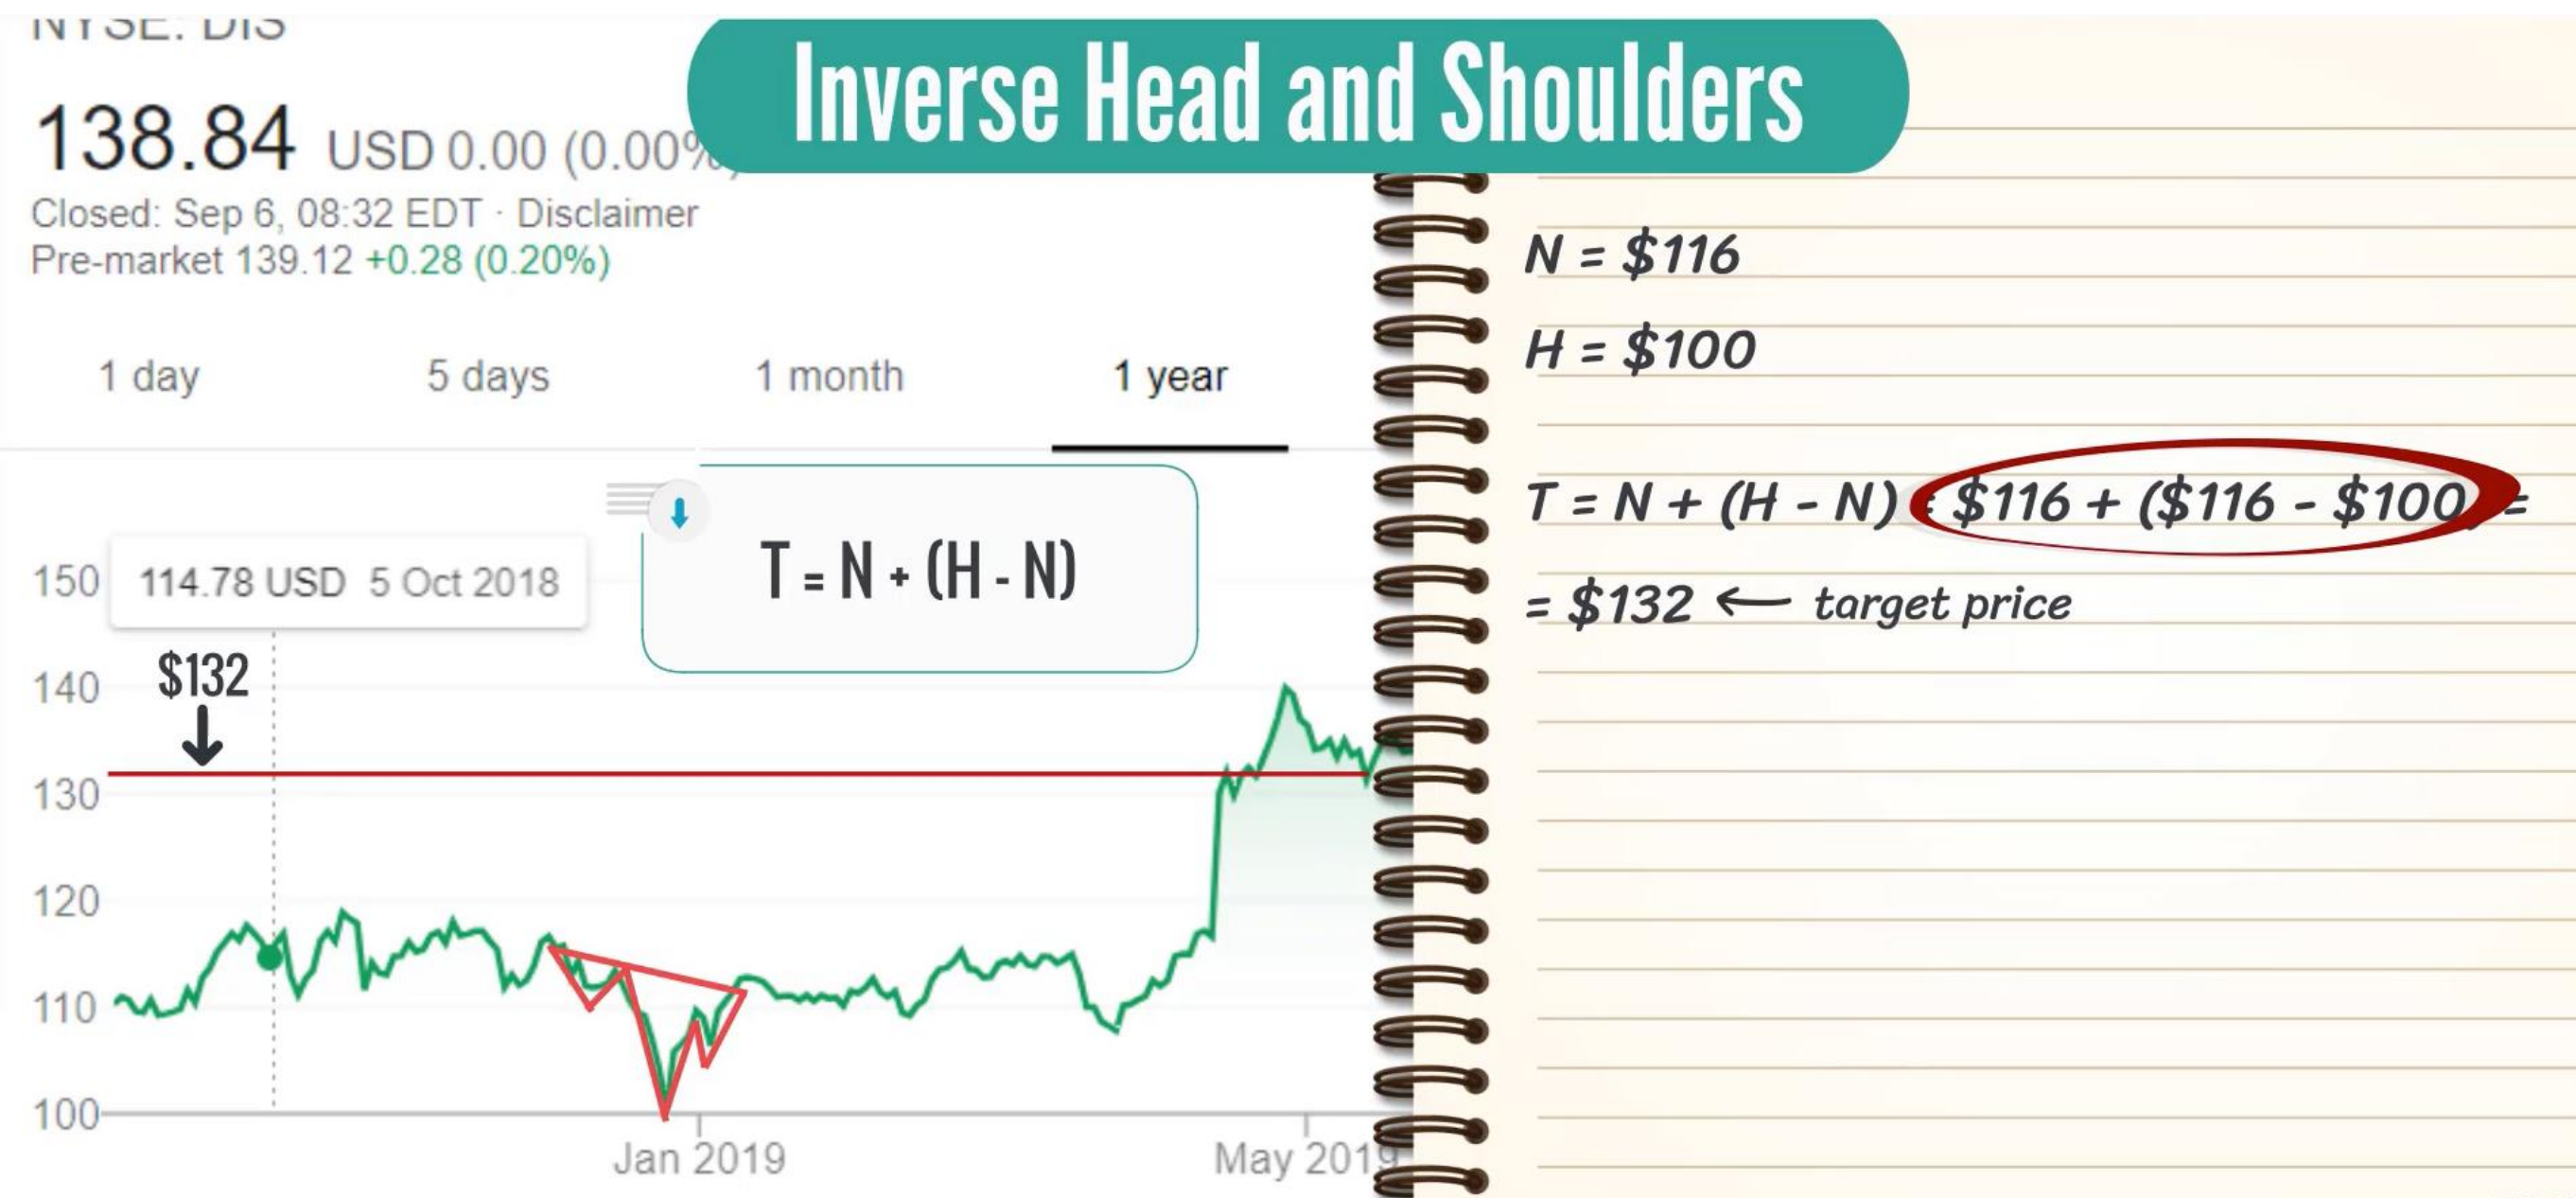

$$N = \$295$$

$$H = \$375$$

$$T = N - (H - N) = \$295 - (\$375 - \$295) = \$215 \leftarrow \text{target price}$$

Inverse Head and Shoulders

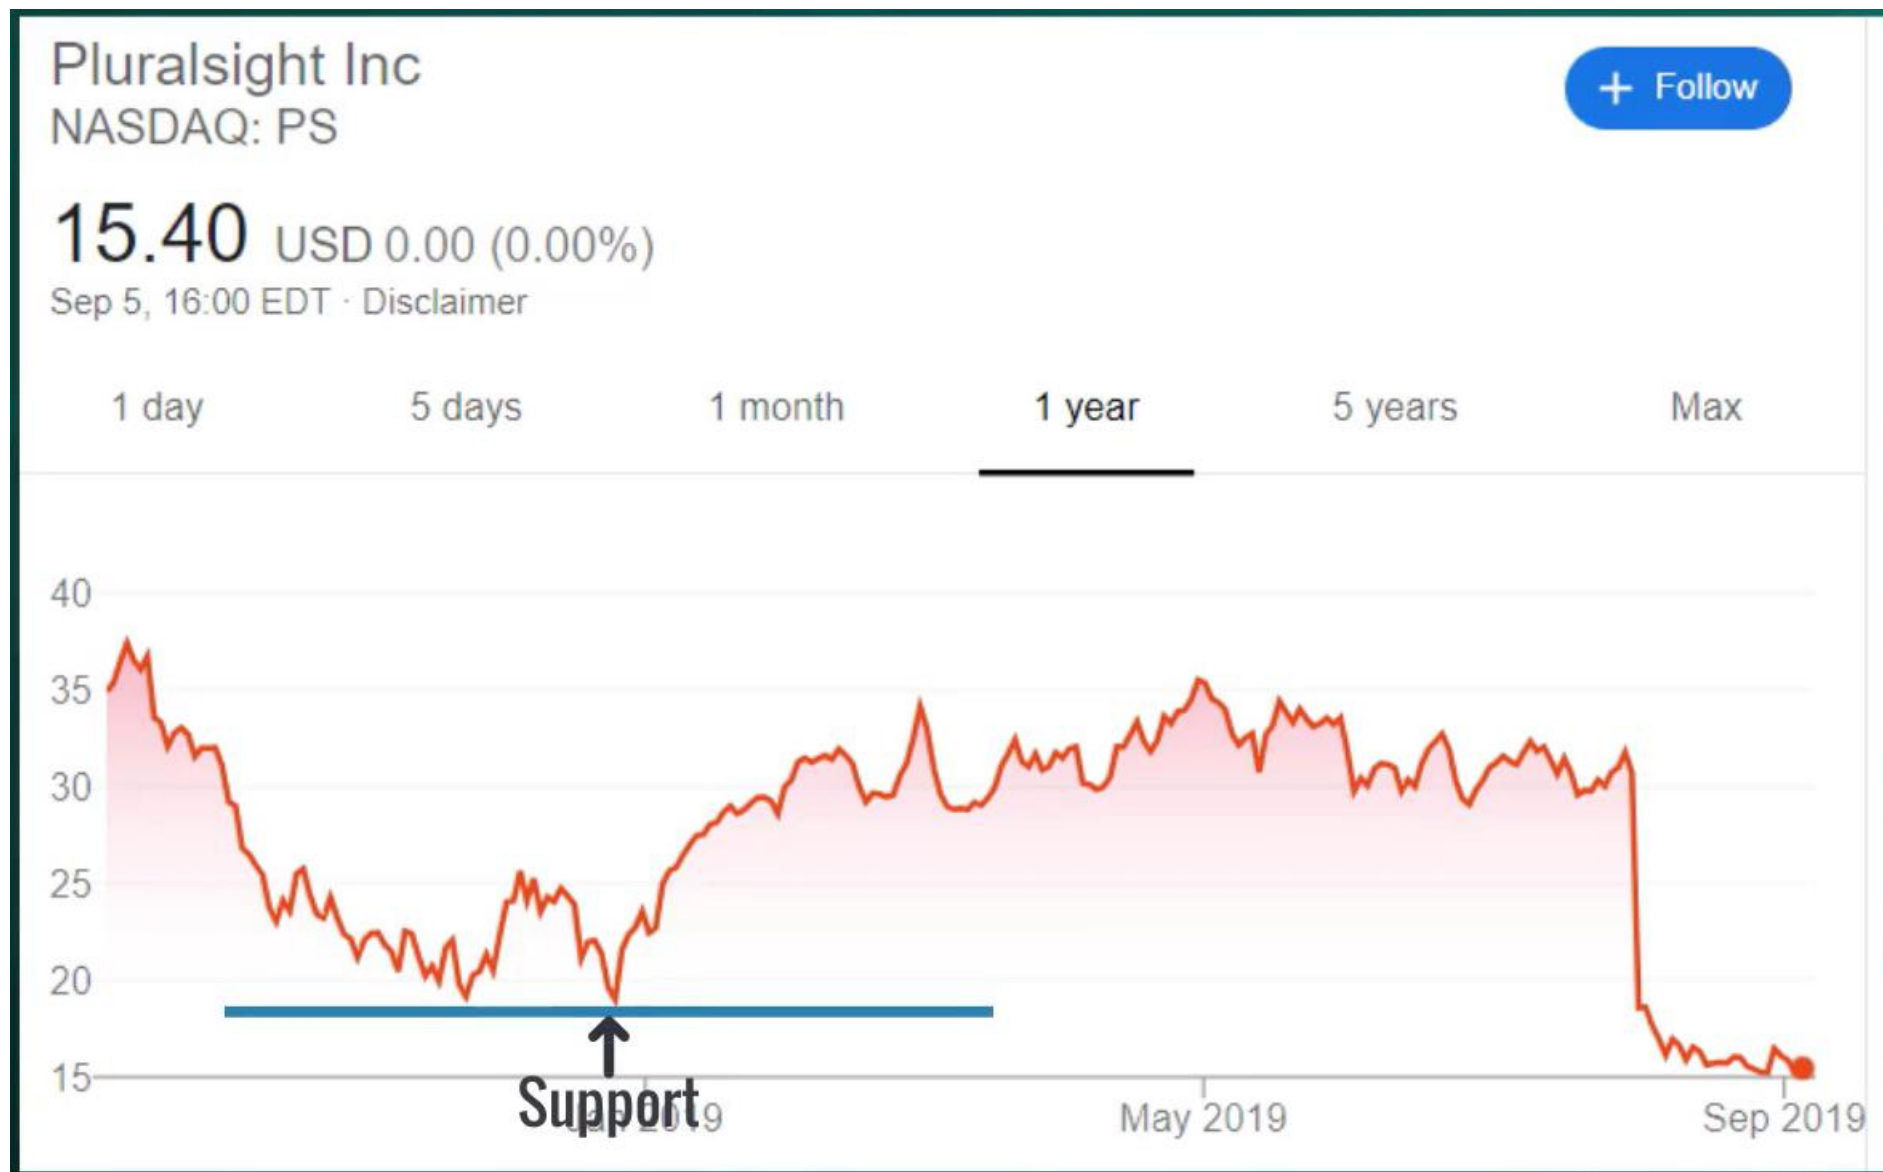

Double/Triple Tops

- If a stock doesn't manage to overcome a resistance two or three times => a significant downward move is about to occur

Double/Triple bottoms

- The price is unable to break through the support level two or three times, indicative that demand for the stock may begin to pick up.

Moving Averages

- Greater tools to reflect on the historical and current price information about traded securities

It consists of calculating the average of the closing prices of a security over a given timeframe.

The most common values are 20 trading days (observations for 1 business month) and 60 days (a business quarter).

Moving Averages

- Moving average is less volatile than closing prices
- Interactions between price & M.A. are informative

Bollinger bands

- Higher volatility means that the range between the two bands would expand
- Some technical analysts apply the so-called “contrarian strategy”
